PowerGrid EV Analytics: Dashboard Report

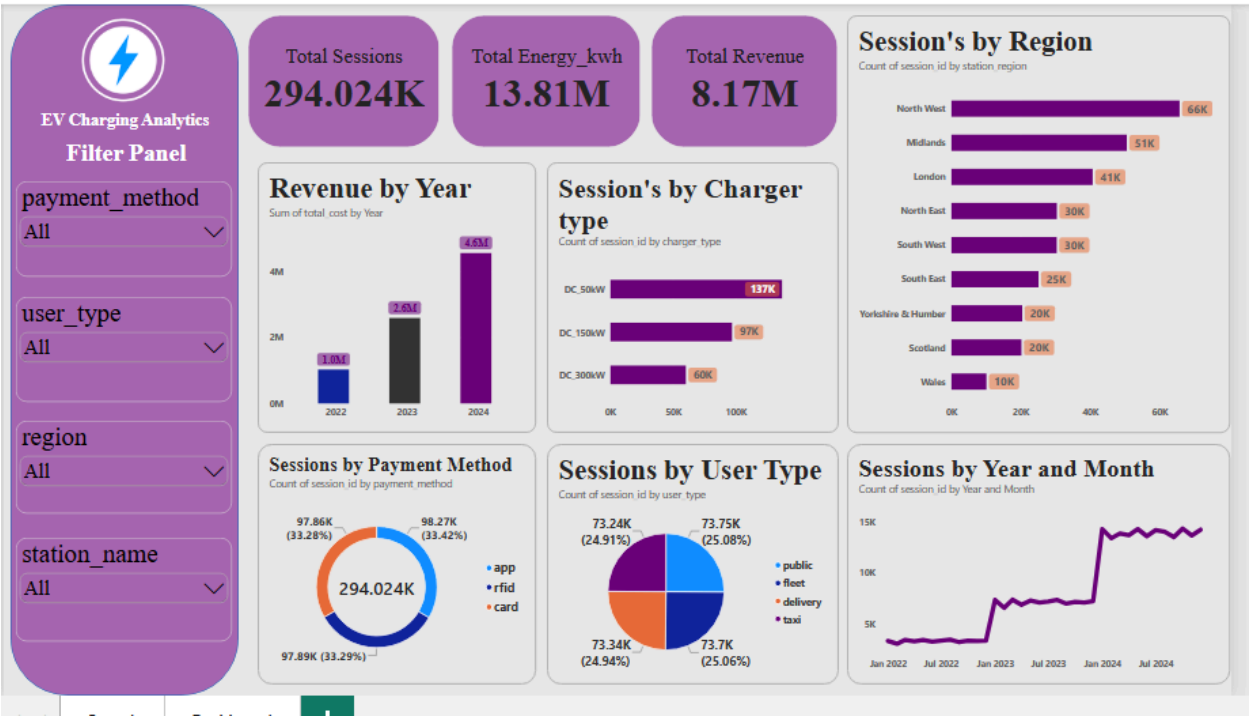

Prepared by: Faizan Haider | Date: 12 October 2026

1- Introduction:

This report explains the Power BI dashboard built from the EV charging dataset. It describes each visual and the main findings from the dataset.

2- Dashboard Overview:

The dashboard has a filter panel on the left (payment method, user type, region and station), three summary cards at the top, and six charts. Any filter chosen in the panel changes the cards and charts together.

3-Visuals:

Visual	What it shows	Reading from the dashboard
Total Sessions	Number of Charging session	294.024K
Total Energy	Energy delivered in kWh	13.81M
Total Revenue	Sum of total cost	8.17M
Revenue by Year	Revenue in each year	1.0M (2022), 2.6M (2023), 4.6M (2024)
Session by Charger type	Sessions on each charger type	50 kW: 137K, 150 kW: 97K, 300 kW: 60K
Session by Region	Sessions in each region	North West 66K, Midlands 51K, London 41K, Wales 10K (lowest)
Session by Payment Method	Share of each payment method	App 33.4%, RFID 33.3%, Card 33.3%
Session by User type	Share of each user type	Each about 25%
Session by Year and Months	Sessions over time	Rises in steps, with jumps in early 2023 and early 2024

4- Insights:

- ★ Revenue grew every year, from 1.0M in 2022 to 4.6M in 2024.
- ★ The 50 kW chargers have the most sessions (137K) and the 300 kW chargers have the fewest (60K).
- ★ North West, Midlands and London have the most sessions, and Wales has the fewest.
- ★ Payment method and user type are spread almost equally, so no single group dominates.

5- Conclusion:

I built a dashboard with filters, summary cards and charts that show sessions, energy and revenue by year, region, charger type, payment method and user type. On the left side of the dashboard we have a filter panel that’s a slicer. They worked one by one and also in the form of All.
