PowerGrid EV Analytics: Data Model and Forecasting Report

Prepared by: Faizan Haider | Date: 11 October 2026

1- Introduction:

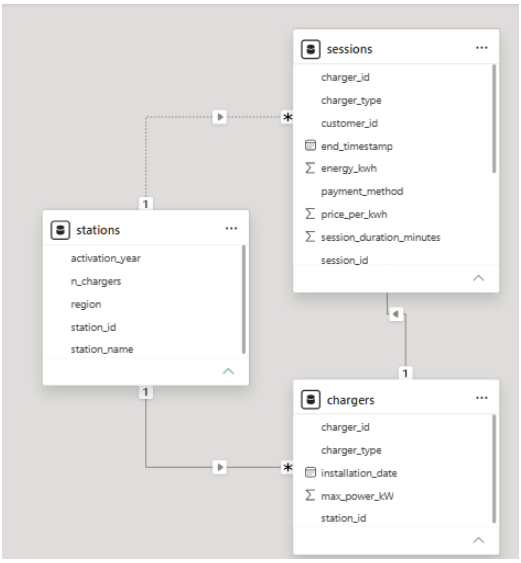

This report explains the data model and the revenue forecast built in Power BI for the EV charging dataset. It shows how the three sheets (Chargers, Sessions and Stations) are connected and how the revenue for the next 12 months was forecast.

2- Data Model:

The three sheets were loaded into Power BI and connected in the Model view, so that one filter can work across all of them. A relationship table are as;

From table	To table	Joined on
Stations	Charger	Station id
Chargers	Sessions	Charger id
Statons	session	station id

Here is a Relationship view ;

Because of these relationships, the slicers for region and station on the dashboard filter the sessions, energy and revenue numbers.

3- Forecasting:

Now we see a forecasting according to our dataset that are ;

(a) Purpose:

The goal was to estimate the revenue for the next 12 months, to help decide how much to invest and where.

(b) Method:

I used the Forecast feature in the Power BI Analytics pane on a line chart. The chart shows monthly revenue (sum of total_cost) from January 2022 to December 2024, which is 36 months. A “Start of Month” column was created for the date axis.

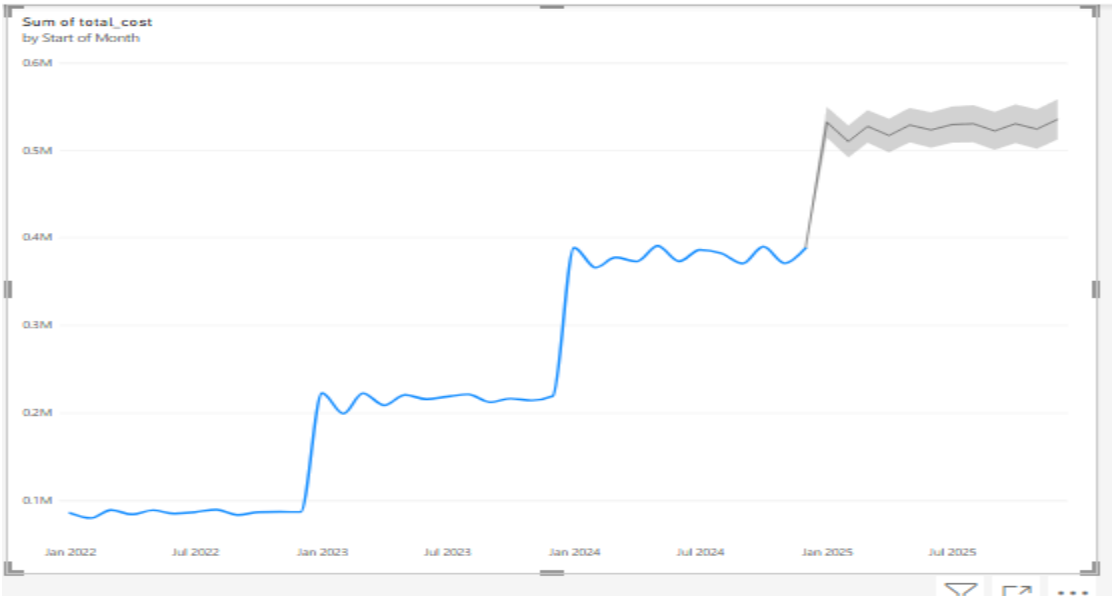

(c) Settings for forecast:

The settings i was uesd for to see forecasting.

Settings	**Values**
Forecast length	12 Months
Confidence interval	95%
Data uesd	Monthly revenue, Jan 2022 to Dec 2024

(d) Forecast chart:

The blue line shows actual revenue. The black line and grey band show the forecast for 2025 with a 95% confidence interval.

(e) Result:

The forecast for January 2025 is 532,026 and for December 2025 is 535,069. This is roughly flat, at about 0.53 million per month. Here is one thing that is ,The forecast is based only on past patterns.

(f) Conclusion:

In this report, I connected the three sheets (Chargers, Sessions and Stations) in the Power BI data model using one-to-many relationships. I then built a 12-month revenue forecast from the monthly revenue of 2022 to 2024. The forecast shows roughly 0.53 million per month in 2025. Its limitations are that it depends only on past patterns and that the dataset has no cost data, so profit could not be calculated.
